REPOELDER J. PRINTED IN THE MALTION AS A TRANSCRIPTION AS EQUENCE AND SEQUENCY.

REPOELDER WITH L(1)OM BUTATIONS SHOW SEVERE MALDEVELOPMENT CORE REPOELDER WITH L(1)OM BUTATIONS SHOW SEVERE MALDEVELOPMENT CORE REPOELDER WITH L(1)OM BUTATIONS SHOW SEVERE MALDEVELOPMENT CORE OF THE VEIT AND AN INCREASED ABDOMINAL PIGMENTATION. THEY DIE DURING THE PUPAL STAGE.

C. -- TISSUE SPECIFICITY: IN THEY DIE DURING THE PUPAL STAGE.

C. -- TISSUE SPECIFICITY: IN THIAD-INSTAR LARVAE IT IS FOUND IN THE BRAIN REGION THAT WILL DEVELOP INTO OPTIC LOBES AND MORE WEAKLY IN THE THORACIC PART OF THE VENTRAL GANGLION.

--- THE THORACIC PART OF THE VENTRAL GANGLION.

--- THE THORACIC PART OF THE VENTRAL GANGLION.

--- EMBRYCGENESIS, THE SECOND DAY OF PUPAL DEVELOPMENT AND IN THE SHOULT.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Jonschker B., Heisenberg M.;

CC -i-FUNCTION: ACG HAS A LARGE EXTRACELULAR DOMAIN WHICH MAY BE INVOLVED IN THE RECOGNITION OF AN EXTRACELULAR SIGNAL PRESENT CC DURING GERMINATION, LEADING TO ACTIVATION OR INHIBITION OF CAMP SYMTHESIS BY THE CYTOPLASMIC DOMAIN.

CC -i-CATALYTIC ACTIVITY: ATD = 3',5'-CYCLIC AMP + diphosphate.

CC -i-ENZYME REGULATION: INSENSITIVE TO GUANINE NUCLEOTIDES.

The specification describes a sequence which encodes a polypeptide capable of specifically altering the flowering time of a plant. The polypeptide is encoded by the FRI (one locus-FRIGIDA) locus of Arabidopsis. The FRI polypucleotide is used to transform plants, so that the flowering time of a plant is altered. This is used, for example, for plants in which the leaves or tubers are a commercial product, where it is desirable to avoid 'blotting' (initiation of flowers and stem elongation) at too early a stage. Conversely, it may be desirable to production across the seasons.
                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 1722 BP; 538 A; 339 C; 348 G; 497

Introducing such sequences into plants to alter these characteristics maximises the reproductive success of the shade of the state of the shade of the sequences of the sequ
                                                                                                                                                                                                                                                                                                                                                                    Sequence 1722

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            D
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Ş
                                                 The present sequence represents a VRN2 sequence from variety Columbia. The specification describes a sequence which encodes a polypeptide capable of specifically altering the flowering time of a plant. The polypeptide is encoded by the FRI (one locus-FRIGIDA) locus of Arabidopsis. The FRI polynucleotide is used to transform plants, so that the flowering time of a plant is altered. This is used, for example, for plants in which the leaves or tubers are a commercial product, where it is desirable to avoid 'blotting' (initiation of flowers and stem elongation) at too early a stage. Conversely, it may be desirable to alter flowering under certain circumstances e.g. to vary flower production across the seasons.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Isolated nucleic acid sequences obtained from the VRN2 locus of a plant encode polypeptides which are capable of affecting one or movernalization responses such as, flowering time, leaf size and/or shape or the shade avoidance response of a plant into which the nucleic acid is introduced. Introducing such sequences into plants to alter these characteristics maximises the reproductive success of the shade of the success of the shade of the sequences of the success of the state of the sequences o

Introducing such sequences into plants to alter these characteristics maximises the reproductive success of the plant. This cDNA was generated from an aberrantly spliced VRN2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Isolated vernalization gene VRN2 is used to produce transgenic plants with altered vernalization response, flowering time, leaf size and/or shape or shade avoidance response for maximized reproductive success

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          03-AUG-2000
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       WO200044918-A1.
                                                                                                                                                                                                Isolated nucleic acid sequences obtained from the VRN2 locus of a plant encode polypeptides which are capable of affecting one or mor vernalization responses such as, flowering time, leaf size and/or vernalization responses such as plant into which the shape or the shade avoidance response of a plant into which the nucleic acid is introduced. Introducing such sequences into plants to alter these characteristics maximises the reproductive success of the state of the sequences.
                                                                                                                                                                                                                                                                                                                                     Isolated vernalization gene VRN2 is used to produce transgenic plants with altered vernalization response, flowering time, leaf size and/or shape or shade avoidance response for maximized reproductive success
                                                                                                                                                                                                                                                                                                                                                                                                 WPI; 2000-499333/44.

                                                           Isolated nucleic acid sequences obtained from the VRN2 locus of a plant encode polypeptides which are capable of affecting one or more vernalization responses such as, flowering time, leaf size and/or shape or the shade avoidance response of a plant into which the nucleic acid is introduced. Introducing such sequences into plants to alter these characteristics maximises the reproductive success of the plant.
                                                                                                                                        Claim 9; Page 72-74; 105pp; English.
                                                                                                                                                Isolated vernalization gene VRN2 is used to produce transgenic plants with altered vernalization response, flowering time, leaf size and/or shape or shade avoidance response for maximized reproductive success
                                                                                                                                                                                                     WPI; 2000-499333/44.
